## Montana's largest wind farm fires up

November 22, 2022 | Bismarck Tribune, The (ND) Author: TOM LUTEY Billings Gazette | Section: A | 523 Words

Page: 004 OpenURL Link

Southeast Montana's Clearwater Wind Project began generating electricity for Puget Sound Energy this month.

The Washington utility announced Nov. 16 that it was receiving power from its 350 megawatt share of the wind project roughly 30 miles northwest of Miles City. Puget acquired the energy through a 2021 purchase power agreement with project owner NextEra.

Clearwater is Montana's largest wind project at 150,000 acres and 269 wind turbines, when completed in 2023. The 750-megawatt project touches three Montana counties, Custer, Garfield, and Rosebud.

"Today is a big day for PSE as we start to bring on new clean energy from the Clearwater Wind Project," said Ron Roberts, PSE vice president of energy supply, in a press release. "This is another step that will help us move towards achieving our goal of reducing our own carbon emissions to net zero by 2045. We know Montana has great wind resources and this agreement demonstrates PSE's continued investment in Montana's energy economy."

Puget is Montana's oldest export energy customer. A stakeholder in Colstrip Power Plant since the 1970s, the Washington utility faces state climate laws requiring the utility to stop servicing its 1.5 million customers with coal power by the end of 2025. A similar law in Oregon has compelled another Colstrip owner, Portland General Electric to buy a 208-megawatt ownership stake in Clearwater.

Portland General Electric should start receiving electricity by the end of 2023. In addition to its owned share of Clearwater, Portland General Electric will buy another 103 megawatts on contract.

Three of Colstrip's four owners in the Pacific Northwest have invested in Montana wind projects in the last four years. PacifiCorp's Pryor Mountain Wind Project near Bridger started spinning in 2021. Pryor's capacity is 250 megawatts.

In the past two years, PacifiCorp's parent company Berkshire Hathaway, has also purchased the Montana Alberta Tie Line, a 190-mile merchant transmission line connecting Great Falls and Lethbridge. The 230-kilovolt capacity line will also move dispatchable Canadian natural gas power south to NorthWestern Energy.

Berkshire also purchased three Montana wind farms serviced by MATL this year. Glacier Wind Energy I and II, as well as Rim Rock Wind Energy are generating assets with a combined capacity of 399 megawatts. They are among the earliest wind farms built in Montana for energy export and were previously owned by NaturEner.

The 230-kilovolt capacity line will also move dispatchable Canadian natural gas power south to NorthWestern Energy.

Berkshire also purchased three Montana wind farms serviced by MATL this year. Glacier Wind Energy I and II, as well as Rim Rock Wind Energy are generating assets with a combined capacity of 399 megawatts. They are among the earliest wind farms built in Montana for energy export and were previously owned by NaturEner.

Three north-central Montana wind farms are the latest assets sought by Berkshire Hathaway, whose subsidiaries have steadily expanded in-state holdings in recent years.

The three wind farms currently owned by NaturEner are located near Cut Bank and the electricity flows into Canada by way of the Montana-Alberta Tie Line, or MATL. Berkshire Hathaway Energy filed paperwork Aug. 2 with the Federal Energy Regulatory Commission to acquire Glacier Wind Energy I, and II, as well as Rim Rock Wind Energy. The generating assets combined capacity is 399 megawatts. They are among the earliest wind farms built in Montana for energy export.

"The proposed transaction will add high-quality assets and dedicated employees to Berkshire Hathaway Energy as the company works to create a sustainable energy future," said Jessi Strawn, BHE vice president of communications. "Berkshire Hathaway Energy is excited to be investing in Montana with this proposed transaction, which is subject to regulatory approvals and expected to close in fourth quarter 2022."

Two years ago, Berkshire Hathaway Energy bought MATL, a 230-Kilovolt capacity transmission line between Great Falls and Lethbridge, Alberta. The 214-mile transmission line was the first connecting power grids in the United States and Canada and came online in 2013. It was also hailed as Montana's first newly constructed major transmission line in two decades.

BHE also tells FERC that 200 megawatts of Canadian electricity will begin traveling south online in January to a customer in Montana yet to be identified. For comparison, 200 MW is the same capacity as NorthWestern Energy's generation from Colstrip Unit 4. In April, FERC approved a transmission service rights agreement between BHE and Calgary-based Heartland Generation.

Heartland operates 10 gas-fired powered plants, including two recently converted to gas from coal. After its first year of 200 megawatts of transmission capacity, Heartland's agreement scales down to 150 megawatts from January 2024 through December 2031.

Berkshire Hathaway investments in Montana electricity generation dates to the 1980s and Units 3 and 4 of Colstrip Power plant. Berkshire subsidiary PacifiCorp owns a 10% share in the units and a similar-size share of capacity on the Colstrip Transmission Line. PacifiCorp is one of the four Colstrip owners facing deadlines to cut coal-power from its portfolio, the first deadline coming at the end of 2025 in Washington.

In 2021, PacifiCorp rolled out plans to cut greenhouse gas emissions to 26% of 2005 levels. That year, the company also completed its 240 megawatt Pryor Mountain Wind Farm near Bridger. A \$406 million project, Pryor Mountain is the largest wind farm currently spinning in Montana. It provides power the PacifiCorp customers in Wyoming and Utah.
